Synthesis and spectroscopic and biological activity for binuclear complexes with Mn(II), Fe(II) and Zn(II) with ligand type N·O·Baidaa K. Salman

Abstract
In this work, the m-phenylene diamine and resorcinol have been used in the synthesis ligand [m-phenylene bis(azo resorcinol)] tetradebate type (N·O·). The tetradebate ligand was reacted with the metal ions Mn(II), Fe(II) and Zn(II) in (1:1) mole ratio via reflux in Ethanol using Et3N as a base to give binuclear complexes of general formula [M2(L)2(H2O)4]. The synthesized compounds were characterized by spectroscopic methods [I.R, UV-VIS and A.A] along with melting point, chloride content and conductivity measurements. These studies revealed an octahedral geometries for Mn(II), Fe(II) and Zn(II) complexes.

The ligand and its complexes exhibited biological activity against the Bacillus(G+) strain and the E.coli(G-) strain.

Introduction
Attention have been paid during the last decade the chemistry of the metal complexes of ligands containing nitrogen and oxygen as donor atoms(1), this could be due to the stability of such ligand complexes(1) and its biological activity along with oxidation catalysis and electro chemical analysis(1,2). m-Phenylenediamine, known as 1,3-diaminobenzene, is an organic compound with the formula C6H4(NH2)2. It is an isomer of o-phenylenediamine and p-phenylenediamine. It is a colourless solid. m-Phenylenediamine is used in the preparation various polymers including aramid fibers, epoxy resins, wire enamel coatings and polyurea elastomers. Other uses for m-phenylenediamine include as an accelerator for adhesive resins, and as a component of dyes for leather and textiles m-phenylenediamine is a "coupling agent", used to produce blue colors.(5)

Resorcinol is benzene-1,3-diol(6), It compound prepared by alkali fusion of 1,3 benzene disulphonic acid. Resorcinol is produced when any of a large number of resins(7). It is one of the main natural phenols in argan oil(8)
Synthesis and spectroscopic and biological activity for binuclear complexes with Mn(II), Fe(II) and Zn(II) with ligand type N-O……………….. Baidaa K. Salman

Resorcinol compound had medical uses as an antiseptic and disinfectant, and is used to 1-7% in ointments in the treatment of chronic skin diseases such as psoriasis, hidradenitis suppurativa, and eczema of a sub-acute character, and in prescription treatments at higher concentrations. Resorcinol is also used as a chemical intermediate for the synthesis of pharmaceuticals and other organic compounds. Azo compounds are used in a variety of cosmetic and as a food coloring, and its biological activity along with oxidation catalysis and electro chemical analysis. The aim of the present study is synthesis, characterise and evaluate the metal complexes as antibacterial agent as promising addition of new class as metal based drugs.

Experimental

Chemicals used were analytical grades; metals were used as chloride salts. I.R data were recorded as (KBr) disc using shimadza £810 s FTIR spectro photometer in the range (2000-400) cm⁻¹. (UV-VIS)spectra were obtained at 25 °C for 1-5 M solution in DMF using a shimadzu £810 spectrophotometer in the range (200-900) nm using quartz cell and electrical conductivity measurements of complexes were recorded at (25 °C) for (1-0-1-0) M solution in DMF as solvent using a pw 5021 digital conductivity meter. The metal content of complexes determined by absorption technique, using shimadza (A.A) £810 G atomic absorption spectrophotometer. The chloride content for complexes was determined by potentiometric titration method using (£810 - titro processor - 665), Dosinatmetrm Swiss. And melting points were obtained using an electrothermal apparatus Stuart. All measurements were obtained in Ibn-sina company. Antibacterial screening was done at laboratories of college of science, University of Baghdad using agar diffusion technique. The metal complexes were screened for their in vitro antibacterial activity against one Gram⁻ negative of (E.coli) and one Gram⁺ positive (Bacillus) bacterial strains.

Synthesis of Ligand [m- phenylene bis(azo resorcinol)] [H₂L]

m-phenylenediamine hydro chloride (1,1g, 10 mmole) was dissolved in warm mixture of 1-ml con. HCl and 1-ml distilled water contained in 20-ml beaker kept in ice salt bath (0-5°C) whilst stirring vigorously, m-phenylenediamine hydro chloride will separate in a finely divided crystalline form. Solution of sodium nitrate (1,1g, 10 mmole) in 1-ml of water was added slowly with stirring to an end – point with potassium ioded – starch paper.

Resorcinol (1,1g, 10 mmole) was dissolved in a solution of potassium hydroxide (1,3g, 10 mmole) in 1-ml water, then cooled in ice bath and added to the diazotized solution with stirring. Concentrated hydrochloride acid was added slowly and with vigorous stirring, and the filtered with gentle suction, washed with distilled water free acid and dried upon filter – paper in the air. Yield percent (81%) and dec. (120)°C.
Synthesis and spectroscopic and biological activity for binuclear complexes with Mn(II),Fe(II) and Zn(II) with ligand type N=O+............................. Baidaa K. Salman

Synthesis of Complexes

Synthesis of the [Mn(II)(L)·(H·O)·I(1)] complex

(0.1 g, 0.5 mmol) of MnCl₂·2H₂O in (1 ml) ethanol was added drop wise to a solution of [H·L] (0.1 g, 0.5 mmol) dissolved in (1 ml) hot ethanol, the PH of the reaction mixture was adjusted by adding Et₃N in equivalent quantity, and the reaction mixture was allowed to reflux for 6 hrs. The mixture was cooled in an ice bath, brown precipitate was collected, washed several times with absolute ethanol and dried, yield (81%), m.p (295.2°C) dec.

Synthesis of [Fe(II)(L)·(H·O)·I(1)] and [Zn(L)·(H·O)·I(1)] complexes:

These complexes were obtained in a similar method to that mentioned in the preparation of complex(1): using FeCl₂·4H₂O and ZnCl₂·2H₂O. The quantity of the compounds were adjusted accordingly. Table (1) state the quantity of starting materials and some physical proprieties of complexes.

Results and Discussion

Synthesis of the Ligand

The ligand was prepared in high yield using one equivalent of m-phenylenediammonium salt and to equivalent of resorcinol at low temperature, scheme (1). The I.R spectrum of the ligand showed bands at (3209 cm⁻¹ and (1475 cm⁻¹) which could be attributed to $\nu$(OH) and $\nu$(OH)₂ hydroxyl groups respectively, also the spectrum showed bands at (1565 cm⁻¹ and (1443 cm⁻¹ which could be attributed to $\nu$(N=N) stretching ortho and meta respectively. Finally the band at (1100 cm⁻¹ could be attributed to $\nu$(C=O) phenolic. The (U.V-Vis) spectrum for the ligand is shown in Fig (1), the results were summarized in Table (2). The Figure exhibited three intense absorption peak at (713 nm, (304) nm and (575 nm) which assigned to (n- $\pi^*$), (n-π*) and (π-π*) transition respectively.

Synthesis of the complexes

The reaction of the ligand [H-L] with Mn(III), Fe(II) and Zn(II) salts was carried out in ethanol. The analytical and physical data Table(1) and spectral data Table(2) and Table (3) are compatible with the suggested structure Fig(1). The I.R spectra of the complexes (1), (2) and (3) are shown in Figs.(1,4 and 5). The bands at (1565 cm⁻¹ and (1443 cm⁻¹ in the free ligand which assigned to $\nu$(N=N) stretching ortho and meta was shifted to lower frequencies and appeared at (1500,1475 cm⁻¹, (1500,1475 cm⁻¹ and (1475,1443 cm⁻¹ indicated the formation of the complexes (1), (2) and (3) respectively.

These bands were assigned to $\nu$(N=N) stretches of reduced bond order, this can be attributed to delocalization of metal-electron densisty into the ligand π-system (HOMO-LUMO). The phenolic (C-O) stretching vibration appeared at (1336 cm⁻¹ in the free ligand was shifted to lower frequencies and appeared
Synthesis and spectroscopic and biological activity for binuclear complexes with Mn(II),Fe(II) and Zn(II) with ligand type N-O+…………………………………. Baidaa K. Salman

at (\(\ddagger, \ddagger\))cm\(^{-1}\), (\(\ddagger, \ddagger\))cm\(^{-1}\) and (\(\ddagger, \ddagger\))cm\(^{-1}\) in the complexes (\(\ddagger\)),(\(\ddagger\)) and (\(\ddagger\)) respectively, indicating a weak linkage between oxygen of phenolic group and the metal ions (\(\ddagger\)). This shift confirms the participation of phenolic oxygen in the (C-O-M) bond. The spectra of the complexes showed the appearance of new bands at (\(\sigma\))cm\(^{-1}\), (\(\sigma\))cm\(^{-1}\) and (\(\sigma\))cm\(^{-1}\) refer to v(M-N) bond for complexes (\(\ddagger\)), (\(\ddagger\)) and (\(\ddagger\)) respectively. The bands confirm also the coordination of the azo nitrogen atom to metal center (\(\ddagger\)). Finally the bands at (\(\ddagger\))cm\(^{-1}\), (\(\ddagger\))cm\(^{-1}\) and (\(\ddagger\)) cm\(^{-1}\) may be assigned to v(M-O) band of complexes(\(\ddagger\)),(\(\ddagger\)) and(\(\ddagger\)) respectively. These confirm also the coordination of the phenolic oxygen atom to metal center. The (U.V-Vis) Spectra for the complexes are shown in Figs.(\(\ddagger\)),(\(\ddagger\)) and (\(\ddagger\)), the results were summarized in table (\(\ddagger\)). The complex(\(\ddagger\)) showed an intense absorption peak at (\(\ddagger\)) nm due to ligand field and two peaks at (\(\ddagger\)) nm and(\(\ddagger\)) may assigned to (C.T) transition, while the weak peak at (\(\ddagger\)) nm was assigned to (d-d) electronic transition type (\(\ddagger\)) suggesting Octahedral geometry around the metal ion This result is in agreement with that reported by Abu-EL-Reash and Co-workers (\(\ddagger\)). On the other hand the complex(\(\ddagger\)) showed three intense absorption peaks at (\(\ddagger\))nm,(\(\ddagger\))nm and(\(\ddagger\))nm assigned to ligand field and (C.T) transitions respectively, while a weak peak at (\(\ddagger\)) nm was assigned to (d-d) electronic transition type (\(\ddagger\)) suggesting octahedral geometry around Fe\(^{2+}\).ion. This result is in agreement with that reported by Kumar and Co-workers (\(\ddagger\)). Finally the complex(\(\ddagger\)) showed a peak at (\(\ddagger\)) nm was assigned to ligand field, while the peak at (\(\ddagger\)) nm was assigned to (C.T) transition (\(\ddagger\)).The metal ion Zn of complex belong to d\(^{1}\) system and this metal do not show (d-d)(\(\ddagger\)) suggestion to an octahedral geometry around the zinc(II) ion (\(\ddagger\)).The molar conductance of the complexes in DMF lie in the range (\(\ddagger\),\(\ddagger\),\(\ddagger\),\(\ddagger\) Ohm\(^{-1}\)cm\(^{-1}\) mol\(^{-1}\)) ,Table(\(\ddagger\)). indicated that complexes (Mn\(^{2+}\), Fe\(^{2+}\) and Zn\(^{2+}\)) are all non-electrolyte (\(\ddagger\)).

**Biological screening**

In our study the synthesised compounds have been screened for their antibacterial activity against the bacillus (G \(^+\)) and E.coli (G \(^-\)) strains by the agar diffusion technique (\(\ddagger\)). Each of the compounds was dissolved in DMF to give a final concentration of (\(\ddagger\),\(\ddagger\),\(\ddagger\)) mg / ml and from the data shown in Table (\(\ddagger\)), and Figs.\(\ddagger\) and \(\ddagger\), compounds (\(\ddagger\)), (\(\ddagger\)) and (\(\ddagger\)) exhibited biological activity against E.coli (G \(^-\)) (Inhibition zone= \(\ddagger\),\(\ddagger\) and \(\ddagger\) mm), but the compounds (\(\ddagger\)), (\(\ddagger\)) and (\(\ddagger\)) exhibited biological activity against Bacillus (G \(^+\)) (Inhibition zone = \(\ddagger\),\(\ddagger\),\(\ddagger\) and \(\ddagger\) mm).

Preparation and Study of Spectroscopic and Biological Activity for Binuclear Complexes with Mn(II), Fe(II) and Zn(II) with Ligand Type N,O

Bidaa K. Salman

University of Baghdad, College of Education for Basic Education, Department of Chemistry

Summary
In this research, the preparation of the ligand was done using resorcinol m-phenylenediamine. The complex was then prepared using the ligand and m-phenylenediamine (resorcinol) to form binuclear complexes with Mn(II), Fe(II) and Zn(II) with ligand type N,O. The results showed that the complexes have high biological activity.
