Al-Mustansiriyah University

## Abstract:

In this paper, we introduce and study new types of open and closed functions called ( **quasi  $rg\alpha$ -open functions** ) and ( **quasi  $rg\alpha$  -closed functions** ). Also, we study the Characterizations and basic properties of quasi  $rg\alpha$ -open functions and quasi  $rg\alpha$ -closed functions .

## Key words:

$rg\alpha$  -open set,  $rg\alpha$  -closed set, quasi  $rg\alpha$  -open function, quasi  $rg\alpha$  -closed function,  $rg\alpha$  -irresolute function and contra  $rg\alpha$ -irresolute function.

## Introduction

The concept of  $rg\alpha$ -open sets was first introduced and studied by A.vadivel [1].Also, The concept of  $rg\alpha$ -open (resp.  $rg\alpha$ -closed) functions was introduced by [5] .The purpose of this paper is to give a new type of open and closed functions called quasi  $rg\alpha$ -open functions and quasi  $rg\alpha$ -closed functions . Also , we study the relation between the quasi  $rg\alpha$ -open (resp. quasi  $rg\alpha$ -closed ) functions and each of open ( resp . closed ) functions ,  $rg\alpha$ -open ( resp.  $rg\alpha$ -closed) functions and  $rg\alpha^*$ -open ( resp.  $rg\alpha^*$ -closed) functions . Moreover, we study the characterizations and basic properties of quasi  $rg\alpha$ - open ( resp. quasi  $rg\alpha$ - closed) functions .

## 1. Preliminaries

### (1.1)Definition: [1].

A subset  $A$  of a topological space  $X$  is said to be

- 1) Regular  $\alpha$ -open set (  $r\alpha$ -open ) if there is a regular open set  $U$  such that  $U \subset A \subset \alpha cl(U)$
- 2)  **$rg\alpha$ -closed** if  $\alpha cl(A) \subset U$  whenever  $A \subset U$  and  $U$  is regular  $\alpha$ -open in  $X$ .

The complement of an  **$rg\alpha$ -closed** set is said to be  **$rg\alpha$ -open**.

The class of all  **$rg\alpha$ -closed** (resp.  **$rg\alpha$ -open**) subsets of  $X$  is denoted by  **$RG\alpha C(X, \tau)$**  (resp.  **$RG\alpha O(X, \tau)$** ) .

**(1.2)Definition [2]:**

A subset  $A$  of a topological space  $X$  is said to be an  **$rg\alpha$ -neighborhood** of a point  $x$  in  $X$  if there exists an  **$rg\alpha$  -open** set  $U$  in  $X$  such that  $x \in U \subset A$  .

**(1.3)Definition [3]:**

Let  $X$  be a topological space and  $A \subset X$  .Then:-

1) The  **$rg\alpha$ -closure** of  $A$  ,denoted by  **$rg\alpha-cl(A)$**  is the intersection of all  **$rg\alpha$  -closed**

sets in  $X$  which contains  $A$  .

2) The  **$rg\alpha$  -interior** of  $A$  , denoted by  **$rg\alpha - int(A)$** is the union of all  **$rg\alpha$ -open** sets in

$X$  which are contained in  $A$  .

**(1.4)Remarks [2]:**

Let  $X$  be a topological space and  $A \subset X$  .Then:-

1) $A \subset rg\alpha-cl(A)$

2)If  $A$  is  $rg\alpha$ -closed in  $X$  then  $A= rg\alpha-cl(A)$ .

3)  $rg\alpha-int(A) \subset A$ .

4)If  $A$  is  $rg\alpha$  -open then  $A= rg\alpha-int(A)$ .

**(1.5)Definition [3]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is said to be  **$rg\alpha$  -continuous** if  $f^{-1}(V)$ is  **$rg\alpha$  -open** set in  $X$  for every open set  $V$  in  $Y$  .

**(1.6)Theorem [3]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is  **$rg\alpha$ --continuous** iff . $f^{-1}(V)$ is  **$rg\alpha$  -closed** set in  $X$  for every closed set  $V$  in  $Y$

**(1.7)Definition [3]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is said to be  **$rg\alpha$ -irresolute** if  $f^{-1}(V)$ is  **$rg\alpha$  -open** set in  $X$  for every  **$rg\alpha$ -open** set  $V$  in  $Y$  .

**(1.8)Theorem:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is  **$rg\alpha$ -irresolute** iff.  $f^{-1}(V)$ is  **$rg\alpha$ -closed** set in  $X$  for every  **$rg\alpha$ -closed** set  $V$  in  $Y$  .

**Proof:** It is obvious.

**(1.9)Definition [4]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is said to be **contra  $rg\alpha$ -irresolute** if  $f^{-1}(V)$ is  **$rg\alpha$ -closed** set in  $X$  for every  **$rg\alpha$ -open** set  $V$  in  $Y$  .

**(1.10)Definition [5]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is said to be  **$rg\alpha$ -open** ( resp.  **$rg\alpha$ -closed** ) if the image of every open ( resp. closed) subset of  $X$  is an  **$rg\alpha$ -open** ( resp.  **$rg\alpha$ -closed** ) set in  $Y$ .

**(1.11)Definition [5]:**

A function  $f : X \rightarrow Y$  from a topological space  $X$  into a topological space  $Y$  is said to be  **$rg\alpha^*$ -open** (resp.  **$rg\alpha^*$ -closed**) if the image of every  **$rg\alpha$ -open** (resp.  **$rg\alpha$ -closed**) subset of  $X$  is an  **$rg\alpha$ -open** (resp.  **$rg\alpha$ -closed**) set in  $Y$ .

**2. Quasi  $rg\alpha$ -open Functions**

We now introduce the following definition:

**(2.1)Definition:**

Let  $X$  and  $Y$  be topological spaces. A function  $f : X \rightarrow Y$  is said to be **quasi  $rg\alpha$ -open** if the image of every  **$rg\alpha$ -open** set in  $X$  is open in  $Y$ .

**(2.2)Theorem:**

Every quasi  **$rg\alpha$ -open** function is open as well as  **$rg\alpha$ -open** .

**Proof:**

Let  $U$  is open in  $X$  since every open is  $rg\alpha$ -open [1] thus  $U$  is  $rg\alpha$ -open ,since  $f$  is quasi  $rg\alpha$ - open thus  $f(U)$ is open so  $f$  is open

To prove  $f$  is  $rg\alpha$ -open let  $U$  is open in  $X$  since  $f$  is open thus  $f(U)$  is open,since every open is  $rg\alpha$ -open thus  $f(U)$ is  $rg\alpha$ -open so  $f$  is  $rg\alpha$ -open .

**(2.3)Remark:**

The converse of (2.2) may not be true in general. Consider the following example .

**Example:**

Let  $X = Y = \{a, b, c\}$  &  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$  .

$\Rightarrow RG\alpha O(X, \tau) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}\}$  .

Let  $f : (X, \tau) \rightarrow (Y, \tau)$  be a function defined by :  $f(a) = a$  ,  $f(b) = b$  &  $f(c) = c$  .

It is clear that  $f$  is  $rg\alpha$  - open as well as open, but  $f$  is not quasi  $rg\alpha$  -open, since  $\{c\}$  is  $rg\alpha$ -open in  $(X, \tau)$  ,but  $f(\{c\}) = \{c\}$  is not open in  $(Y, \tau)$  .

**(2.4)Theorem:**

Every quasi  $rg\alpha$ -open function is  **$rg\alpha^*$ -open** .

**Proof:** let  $U$  is  $rg\alpha$ -open ,since  $f$  is quisi  $rg\alpha$ -open thus  $f(U)$  is open ,since every open set is  $rg\alpha$ -open [ 1] thus  $f$  is  $rg\alpha^*$ -open .

**(2.5)Remark:**

The converse of (2.4) may not be true in general. Consider the following example.

**Example:**

Let  $X = Y = \{a, b, c\}$  &  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$  .  $RG\alpha O(X, \tau) = \{X, \phi, \{a\}, \{c\}, \{b\}, \{a, b\}\}$

Let  $f : (X, \tau) \rightarrow (Y, \tau)$  be a function defined by :  $f(a) = b$  ,  $f(b) = a$  &  $f(c) = c$  .

It is clear that  $f$  is  $rg\alpha^*$ -open ,but  $f$  is not quasi  $rg\alpha$ -open, since  $\{c\}$  is  $rg\alpha$ -open in  $(X, \tau)$  , but  $f(\{c\}) = \{c\}$  is not open in  $(Y, \tau)$ .

**Thus we have the following diagram:**

$$\begin{array}{ccc} \text{quasi } rg\alpha\text{-open function} & \Rightarrow & rg\alpha^*\text{-open function} \\ \Downarrow & & \Downarrow \\ \text{open function} & \Rightarrow & rg\alpha\text{-open function} \end{array}$$

**(2.6)Theorem:**

Let  $f : X \rightarrow Y$  be a function from a topological space  $X$  to a topological space  $Y$ . Then  $f$  is quasi  $rg\alpha$ -open if for each  $x \in X$  and each  $rg\alpha$ -neighborhood  $U$  of  $x$  in  $X$ , there exists a neighborhood  $V$  of  $f(x)$  in  $Y$  such that  $V \subset f(U)$ .

**Proof:**

Let  $U$  be an arbitrary  $rg\alpha$  - open set in  $X$ . Then for each  $y \in f(U)$  there exists  $x \in U$  such that  $f(x) = y$ . By hypothesis there exists a neighborhood  $V_y$  of  $y$  in  $Y$  such that  $V_y \subset f(U)$ .

Since  $V_y$  is a neighborhood of  $y$  ,then there exists an open set  $W_y$  in  $Y$  such that  $y \in W_y \subset V_y$ .

Thus  $f(U) = \bigcup_{y \in f(U)} W_y$  which is an open set in  $Y$  . This implies that  $f$  is quasi

$rg\alpha$ -open function .

**(2.7)Theorem:**

Let  $X$  and  $Y$  be topological spaces. A function  $f : X \rightarrow Y$  is quasi  $rg\alpha$ -open iff. for any subset

$B$  of  $Y$  and for any  $rg\alpha$  -closed set  $F$  of  $X$  containing  $f^{-1}(B)$ , there exists a closed set  $G$  of  $Y$  containing  $B$  such that  $f^{-1}(G) \subset F$  .

**Proof:**  $\Rightarrow$

Suppose that  $f$  is quasi  $rg\alpha$  -open. Let  $B \subset Y$  and  $F$  be an  $rg\alpha$  -closed subset of  $X$  such that  $f^{-1}(B) \subset F$  . Now, put  $G = Y - f(X - F)$ .

Since  $f^{-1}(B) \subset F \Rightarrow X - F \subset f^{-1}(B^c) \Rightarrow f(X - F) \subset f(f^{-1}(B^c)) \subset B^c$   
 $\Rightarrow B \subset Y - f(X - F) \Rightarrow B \subset G$ . Since  $f$  is quasi  $rg\alpha$  -open , then  $G$  is a closed subset of  $Y$ . Moreover, we have  $f^{-1}(G) \subset F$  .

**Conversely**, let  $U$  be an  $rg\alpha$  -open set in  $X$  .To prove that  $f(U)$  is an open set in  $Y$  Put  $B = Y - f(U)$  , then  $X - U$  is an  $rg\alpha$  -closed set in  $X$  such that  $f^{-1}(B) \subset X - U$  .

By hypothesis, there exists a closed subset  $F$  of  $Y$  such that  $B \subset F$  and  $f^{-1}(F) \subset X - U$  .

Hence, we obtain  $f(U) \subset Y - F$ . On the other hand ,since  $B \subset F \Rightarrow Y - F \subset Y - B = f(U) \Rightarrow Y - F \subset f(U)$ . Thus  $f(U) = Y - F$  which is open and hence  $f$  is a quasi  $rg\alpha$  -open function .

**(2.8)Theorem:**

Let  $X$  and  $Y$  be two topological spaces. A function  $f: X \rightarrow Y$  is quasi  $rg\alpha$ -open iff  $f^{-1}(cl(B)) \subset rg\alpha-cl(f^{-1}B)$  for every subset  $B$  of  $Y$ .

**Proof:**  $\Rightarrow$

Suppose that  $f$  is quasi  $rg\alpha$ -open. To prove that  $f^{-1}(cl(B)) \subset rg\alpha-cl(f^{-1}B)$  for every subset  $B$  of  $Y$ . Since  $f^{-1}(B) \subset rg\alpha-cl(f^{-1}B)$  for any subset  $B$  of  $Y$ , then by (2.7) there exists a closed set  $F$  in  $Y$  such that  $B \subset F$  and  $f^{-1}(F) \subset rg\alpha-cl(f^{-1}B)$ . Since  $B \subset F \Rightarrow cl(B) \subset cl(F) = F$ .

Therefore, we obtain  $f^{-1}(cl(B)) \subset f^{-1}(F) \subset rg\alpha-cl(f^{-1}B)$ .

Thus  $f^{-1}(cl(B)) \subset rg\alpha-cl(f^{-1}B)$  for every subset  $B$  of  $Y$ .

**Conversely**, let  $B \subset Y$  and  $F$  be an  $rg\alpha$ -closed subset of  $X$  such that  $f^{-1}(B) \subset F$ . then we

have  $B \subset cl(B)$  and  $f^{-1}(cl(B)) = f^{-1}(cl(B)) \subset rg\alpha-cl(f^{-1}B) \subset rg\alpha-cl(F) = F$   
 (By(1.4)no.2)

Then by theorem (2.7)  $f$  is a quasi  $rg\alpha$ -open function.

However the following theorem holds. The proof is easy and hence omitted.

**(2.9)Theorem:**

Let  $X, Y, Z$  be three topological spaces, and  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two functions. Then:-

- 1) If  $f$  and  $g$  are quasi  $rg\alpha$ -open, then  $g \circ f$  is quasi  $rg\alpha$ -open.
- 2) If  $f$  and  $g$  are quasi  $rg\alpha$ -open, then  $g \circ f$  is  $rg\alpha^*$ -open.
- 3) If  $f$  is quasi  $rg\alpha$ -open and  $g$  is open, then  $g \circ f$  is quasi  $rg\alpha$ -open.
- 4) If  $f$  is quasi  $rg\alpha$ -open and  $g$  is  $rg\alpha$ -open, then  $g \circ f$  is  $rg\alpha^*$ -open.
- 5) If  $f$  is quasi  $rg\alpha$ -open and  $g$  is  $rg\alpha^*$ -open, then  $g \circ f$  is  $rg\alpha^*$ -open.
- 6) If  $f$  is  $rg\alpha$ -open and  $g$  is quasi  $rg\alpha$ -open, then  $g \circ f$  is open.
- 7) If  $f$  is  $rg\alpha^*$ -open and  $g$  is quasi  $rg\alpha$ -open, then  $g \circ f$  is quasi  $rg\alpha$ -open.
- 8) If  $f$  is open and  $g$  is quasi  $rg\alpha$ -open, then  $g \circ f$  is open.

**(2.10)Theorem:**

Let  $X, Y, Z$  be three topological spaces, and  $f: X \rightarrow Y, g: Y \rightarrow Z$  be two functions. Then:-

- 1) If  $g \circ f$  is quasi  $rg\alpha$ -open and  $g$  is continuous and one-to-one, then  $f$  is quasi  $rg\alpha$ -open.
- 2) If  $g \circ f$  is quasi  $rg\alpha$ -open and  $g$  is  $rg\alpha$ -continuous and one-to-one, then  $f$  is  $rg\alpha^*$ -open.
- 3) If  $g \circ f$  is contra  $rg\alpha$ -irresolute and  $g$  is quasi  $rg\alpha$ -open and one-to-one, then  $f$  is contra  $rg\alpha$ -irresolute.
- 4) If  $g \circ f$  is quasi  $rg\alpha$ -open and  $f$  is  $rg\alpha$ -irresolute and onto, then  $g$  is open.

**Proof:**

1) To prove that  $f : X \rightarrow Y$  is quasi  $rg\alpha$ -open .

Let  $U$  be an  $rg\alpha$ -open subset of  $X$ , since  $g \circ f$  is quasi  $rg\alpha$ -open, then  $(g \circ f)(U)$  is open in  $Z$ . Since  $g$  is continuous, then  $g^{-1}(g \circ f(U)) = (g^{-1} \circ g)(f(U))$  is open in  $Y$ .

Since  $g$  is one-to-one, then  $f(U)$  is open in  $Y$ . Thus  $f : X \rightarrow Y$  is a quasi  $rg\alpha$ -open function .

2) To prove that  $f : X \rightarrow Y$  is  $rg\alpha$ \*-open .

Let  $U$  be an  $rg\alpha$ -open subset of  $X$ , since  $g \circ f$  is quasi  $rg\alpha$ -open, then  $(g \circ f)(U)$  is open in  $Z$

Since  $g$  is  $rg\alpha$ -continuous, then  $g^{-1}(g \circ f(U)) = (g^{-1} \circ g)(f(U))$  is  $rg\alpha$ -open in  $Y$ . Since  $g$  is one-to-one, then  $f(U)$  is  $rg\alpha$ -open in  $Y$ . Thus  $f : X \rightarrow Y$  is an  $rg\alpha$ \*-open function .

3) To prove that  $f : X \rightarrow Y$  is contra  $rg\alpha$ -irresolute .

Let  $U$  be an  $rg\alpha$ -open subset of  $Y$ , since  $g$  is quasi  $rg\alpha$ -open, then  $g(U)$  is open in  $Z$  .

Since every open set is  $rg\alpha$ -open , then  $g(U)$  is  $rg\alpha$ -open in  $Z$  . Since  $g \circ f$  is contra  $rg\alpha$ -irresolute, then  $(g \circ f)^{-1}(g(U))$  is  $rg\alpha$ -closed in  $X$ , since

$g$  is one-one , then  $(g \circ f)^{-1}(g(U)) = f^{-1}((g^{-1} \circ g)(U)) = f^{-1}(U)$  is an  $rg\alpha$ -closed set in  $X$  , hence  $f^{-1}(U)$  is  $rg\alpha$ -closed in  $X$  . Thus  $f : X \rightarrow Y$  is contra  $rg\alpha$ -irresolute .

4) To prove that  $g : Y \rightarrow Z$  is open .

Let  $U$  be an open subset of  $Y$ , then  $U$  is an  $rg\alpha$ -open subset of  $Y$ , since  $f$  is  $rg\alpha$ -irresolute

then  $f^{-1}(U)$  is an  $rg\alpha$ -open set in  $X$ , since  $g \circ f$  is quasi  $rg\alpha$ -open,

then  $(g \circ f)(f^{-1}(U)) = g(f \circ f^{-1}(U))$  is open in  $Z$ .

Since  $f$  is onto , then  $g(U)$  is open in  $Z$  .

Thus  $g : Y \rightarrow Z$  is an open function .

**(2.11)Theorem:**

Let  $f : X \rightarrow Y$  be a quasi  $rg\alpha$ -open function and  $A$  be an open subset of  $X$ , then the restriction function  $f \setminus A : A \rightarrow Y$  is a quasi  $rg\alpha$ -open function.

**Proof:**

Let  $U$  be an  $rg\alpha$ -open subset of  $A$ , Since  $A$  is an open subset of  $X$ , then by [1],  $U$  is  $rg\alpha$ -open in  $X$ , since  $f : X \rightarrow Y$  is a quasi  $rg\alpha$ -open function , then  $(f \setminus A)(U) = f(U)$  is open in  $Y$ . Thus the restriction function  $f \setminus A : A \rightarrow Y$  is a quasi  $rg\alpha$ -open function .

**3. Quasi  $rg\alpha$ -closed Functions**

**(3.1)Definition:**

Let  $X$  and  $Y$  be two topological spaces. A function  $f : X \rightarrow Y$  is said to be **quasi  $rg\alpha$  -closed** if the image of every  $rg\alpha$ -closed set in  $X$  is closed in  $Y$ .

**(3.2)Theorem:**

Every quasi  $rg\alpha$ -closed function is closed as well as  $rg\alpha$ -closed .

**Proof:** It is obvious.

**(3.3)Remark:**

The converse of (3.2) may not be true in general. Consider the following example

**Example:** Let  $X = Y = \{a, b, c\}$  &  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$  .

$$\tau^c = \{X, \phi, \{b, c\}, \{a, c\}, \{c\}\}$$

$$\Rightarrow RG\alpha O(X, \tau) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}\}.$$

$$RG\alpha C(X, \tau) = \{X, \phi, \{b, c\}, \{a, c\}, \{a, b\}, \{c\}\}$$

Let  $f : (X, \tau) \rightarrow (Y, \tau)$  be a function defined by :  $f(a) = a, f(b) = b$  &  $f(c) = c$  .

It is clear that  $f$  is  $rg\alpha$ -closed as well as closed , but  $f$  is not quasi  $rg\alpha$  -closed , Since  $\{a, b\}$  is  $rg\alpha$  - closed in  $(X, \tau)$  , but  $f(\{a, b\}) = \{a, b\}$  is not closed in  $(Y, \tau)$  .

**(3.4)Theorem:**

Every quasi  $rg\alpha$ -closed function is  $rg\alpha^*$ -closed .

**Proof:** It is obvious.

**(3.5)Remark:**

The converse of (3.4) may not be true in general. In (2.5) ,  $f$  is  $rg\alpha^*$ - closed , but  $f$  is not quasi  $rg\alpha$ -closed ,since  $\{a, b\}$  is  $rg\alpha$ -closed in  $(X, \tau)$  ,but  $f(\{a, b\}) = \{a, b\}$  is not closed in  $(Y, \tau)$  .

Thus we have the following diagram:

**(3.6)Theorem:**

Let  $X$  and  $Y$  be two topological spaces . A bijective function  $f : X \rightarrow Y$  is quasi  $rg\alpha$  - closed iff. it is quasi  $rg\alpha$ -open .

**Proof:**

Let  $f$  be a quasi  $rg\alpha$ -closed function . To prove that  $f$  is a quasi  $rg\alpha$ -open function

Let  $U$  be an  $rg\alpha$ -open set in  $X \Rightarrow U^c$  is  $rg\alpha$ -closed in  $X$  . Since  $f$  is quasi  $rg\alpha$ -closed , then  $f(U^c)$  is closed in  $Y$  .Therefore  $(f(U^c))^c$  is open in  $Y$  . Since  $f$  is a bijective function , then  $(f(U^c))^c = f(U) \Rightarrow f(U)$  is open in  $Y$

Thus  $f : X \rightarrow Y$  is a quasi  $rg\alpha$ -open function .

**Conversely,** Suppose that  $f : X \rightarrow Y$  is quasi  $rg\alpha$  -open . To prove that  $f$  is quasi  $rg\alpha$ -closed .

Let  $F$  be an  $rg\alpha$ -closed set in  $X \Rightarrow F^c$  is  $rg\alpha$  - open in  $X$  . Since  $f$  is quasi  $rg\alpha$  - open , then  $f(F^c)$  is open in  $Y$  .Therefore  $(f(F^c))^c$  is closed in  $Y$  . Since  $f$  is a bijective function then  $(f(F^c))^c = f(F) \Rightarrow f(F)$  is closed in  $Y$  . Thus  $f : X \rightarrow Y$  is a quasi  $rg\alpha$ -closed function .

**(3.7)Theorem:**

Let  $X$  and  $Y$  be two topological spaces. A function  $f : X \rightarrow Y$  is quasi  $rg\alpha$ -closed iff. for any subset  $B$  of  $Y$  and for any  $rg\alpha$ -open set  $G$  of  $X$  containing  $f^{-1}(B)$ , there exists an open set  $U$  of  $Y$  containing  $B$  such that  $f^{-1}(U) \subset G$ .

**Proof:**

This proof is similar to that of theorem (2.7).

However the following theorem holds. The proof is easy and hence omitted

**(3.8)Theorem**

Let  $X, Y, Z$  be three topological spaces ,and  $f : X \rightarrow Y, g : Y \rightarrow Z$  be two functions. Then:-

- 1) If  $f$  and  $g$  are quasi  $rg\alpha$ -closed ,then  $g \circ f$  is quasi  $rg\alpha$ -closed .
- 2) If  $f$  and  $g$  are quasi  $rg\alpha$ -closed ,then  $g \circ f$  is  $rg\alpha^*$ -closed .
- 3) If  $f$  is quasi  $rg\alpha$ -closed and  $g$  is closed , then  $g \circ f$  is quasi  $rg\alpha$ -closed .
- 4) If  $f$  is quasi  $rg\alpha$ -closed and  $g$  is  $rg\alpha$ -closed , then  $g \circ f$  is  $rg\alpha^*$ -closed .
- 5) If  $f$  is quasi  $rg\alpha$ -closed and  $g$  is  $rg\alpha^*$ -closed , then  $g \circ f$  is  $rg\alpha^*$ -closed .
- 6) If  $f$  is  $rg\alpha$  -closed and  $g$  is quasi  $rg\alpha$ -closed , then  $g \circ f$  is closed .
- 7) If  $f$  is  $rg\alpha^*$  -closed and  $g$  is quasi  $rg\alpha$ -closed , then  $g \circ f$  is quasi  $rg\alpha$ -closed .
- 8) If  $f$  is closed and  $g$  is quasi  $rg\alpha$ -closed , then  $g \circ f$  is closed .

**(3.10)Theorem:**

Let  $X, Y, Z$  be three topological spaces ,and  $f : X \rightarrow Y, g : Y \rightarrow Z$  be two functions. Then:-

- 1) If  $g \circ f$  is quasi  $rg\alpha$ -closed and  $g$  is continuous and one-to-one , then  $f$  is quasi  $rg\alpha$ -closed .
- 2) If  $g \circ f$  is quasi  $rg\alpha$  -closed and  $g$  is  $rg\alpha$  - continuous and one-to-one, then  $f$  is  $rg\alpha^*$ -closed .
- 3) If  $g \circ f$  is quasi  $rg\alpha$ -closed and  $f$  is  $rg\alpha$ -irresolute and onto, then  $g$  is closed
- 4) If  $g \circ f$  is contra  $rg\alpha$ - irresolute and  $f$  is quasi  $rg\alpha$  - closed and onto , then  $g$  is contra  $rg\alpha$ -irresolute .

**Proof:**

The proof is similar to that of theorem (2.10).Hence is omitted.

**الخلاصة**

في هذا البحث قمنا بدراسة أنواع جديدة من الدوال المفتوحة والدوال المغلقة أسميناها بالدول تقريبا المفتوحة- $rg\alpha$  quasi  $rg\alpha$  -open functions) والدوال تقريبا المغلقة  $rg\alpha$ -(quasi  $rg\alpha$ -closed functions) كذلك درسنا المكافئات والخواص الأساسية للدوال تقريبا المفتوحة- $rg\alpha$  و الدوال تقريبا المغلقة- $rg\alpha$  .
