

# Synthesis of new N-Substituted -3- chloro -2- azetidinones for 2, 4-Diamino-6-phenyl-1,3,5-triazine

**Tamador A. Mahmood**

Department of Chemistry, College of Science for Woman  
University of Baghdad

## Abstract:

The current study involved synthesis of several new N-Substituted -3- chloro -2- azetidinones for 2,4-Diamino-6-phenyl-1,3,5-triazine by two steps. The first step includes preparation of Schiff bases (A1-A6) by condensation of 2,4-Diamino-6-phenyl-1,3,5-triazine with many substituted aldehydes, then the second step includes preparation new six azetidinone compounds (B1-B6) by reaction of chloro acetyl chloride with the prepared Schiff bases in first step. The prepared compounds were characterized by physical properties, FT-IR, UV and some of them by  $^1\text{H-NMR}$ ,  $^{13}\text{C-NMR}$  spectroscopy were recorded.

**Keywords:** 2, 4-Diamino-6-phenyl-1, 3, 5-triazine, Schiffbase, azetidinones.

## Introduction:

Schiff bases are characterized by the (N=CH) imines group which important compounds in medicinal and pharmaceutical field <sup>[1]</sup>. They show biological activities including antibacterial, antifungal <sup>[2,3]</sup>, anticancer <sup>[4]</sup> and herbicidal activities <sup>[5]</sup> figure (1) shows the structure for this component. Fur their more Schiff bases have been widely used as protective group of amino group in organic synthesis <sup>[6, 7]</sup>. Schiff bases react with chloroacetyl chloride to give ( $\beta$  - Lactam) 3-chloro-2-azetidinones.

## Synthesis of new N-Substituted -3- chloro -2- azetidiones for 2, 4-Diamino-6-phenyl-1,3,5-triazine ..... Tamador A. Mahmood

The  $\beta$  – Lactam heterocycles are still the most prescribed antibiotics used in medicine. They are considered as an important contribution of science to humanity [8]. The most widely used antibiotics such as the Penicillins, Cephalosporins, Carbamoyl, aztreonam and Nocardinocins all contain  $\beta$  – Lactam rings [9]. The long term use of  $\beta$  – Lactam antibiotics exerts selective pressure on bacteria and permits the proliferation of resistant organisms [10]. A comparative study of current antibiotics with those from decades shows an alarming increase in bacterial resistance to  $\beta$  – Lactam antibiotics [11]. The development of several synthetic and semi-synthetic  $\beta$  – Lactam antibiotic by the pharmaceutical industry was due to the growing resistance of bacteria towards the  $\beta$  – Lactam antibiotics and the need for medicines with a more specific antibacterial activity. An interesting group of  $\beta$  – Lactam are the monocyclic  $\beta$  – Lactams, which are molecules that do not contain another ring fused to the  $\beta$  – Lactam one. Azetidiones, which are part of the antibiotic structure, are known to exhibit interesting biological activities [12]. A large number of 3-chloro monocyclic  $\beta$  – Lactams possess powerful antibacterial, antimicrobial, anti-inflammatory, anticonvulsant and antitubercular activity [13].

### Material and Methods:

#### General:

Chemicals employed were of analytical grade and used without further purification. Melting points were determined on Gallenkamp capillary melting point apparatus and were uncorrected. FT-IR spectra were recorded using KBr discs on SHIMADZU FT-IR 8400 Fourier Transform Infrared spectrophotometer. U.V. spectra recorded using SHIMADZU UV-visible recording spectrophotometer U.V 160.  $^1\text{H-NMR}$  and  $^{13}\text{C-NMR}$  spectra were recorded on Bruker spectrometer in Ultra shield 300 MHz instrument using tetramethylsilane (TMS) as an internal standard and DMSO- $d_6$  as a solvent in Al-Balqa University in Jordan.

#### Preparation of Schiff base (A1-A6)

A series of Schiff bases (A1-A6) were prepared from the reaction of 2, 4-diamino-6-phenyl-1,3,5-triazine (0.01 mol) with different aldehyde (0.02 mol) in 25 ml ethanol absolute and drops of glacial acetic acid. This mixture was refluxed for 5 hrs. The precipitate was filtered and recrystallized from ethanol and water. Melting points, yield% data are listed in table (1).

#### Preparation of Azetidione from Schiff base (B1-B6) [1, 2].

To a mixture of compounds (A1-A6) respectively (0.01 mol) in N,N'-Dimethyl formamide (15 ml), triethylamine (0.025 mol), was added chloroacetyl chloride (0.025 mol) drop-wise at 5-10  $^{\circ}\text{C}$ . The reaction mixture

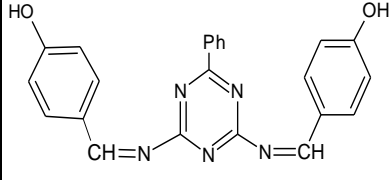

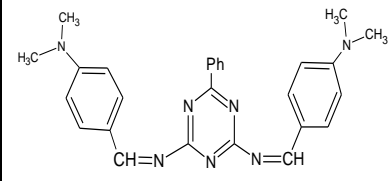

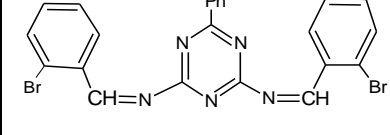

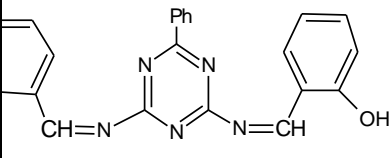

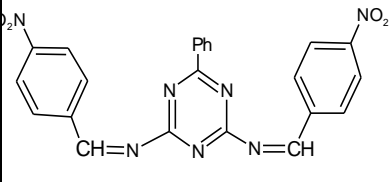

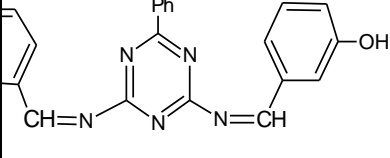

**Synthesis of new N-Substituted -3- chloro -2- azetidinones for 2, 4-Diamino-6-phenyl-1,3,5-triazine ..... Tamador A. Mahmood**

was then stirred for 6 hrs. And left at room temperature for 24 hours then poured into crushed ice. The solid separated was dried and recrystallized from ethanol and water. Melting points, yield% data are listed in Table (2).

## Synthesis of new N-Substituted -3- chloro -2- azetidinones for 2, 4-Diamino-6-phenyl-1,3,5-triazine ..... Tamador A. Mahmood

### Result and Discussion:

The present work involved two steps:

**First step:** includes preparation of new six Schiff bases (A1-A6) were prepared from the reaction of 2, 4-diamino-6-phenyl-1,3,5- triazine with different substituted aldehyde .The synthesis of these compound was carried out lined in scheme (1), and the physical properties of Schiff bases (A1-A6) including melting point range of (132-243)°C and % yield were range of ( 43.2-63.72 ) and these compounds were identified by FT-IR spectroscopy , FT-IR spectrum of (A1) showed characteristic absorption bands ( 1670 ) $\text{cm}^{-1}$  , ( 3169 )  $\text{cm}^{-1}$  , ( 2875 )  $\text{cm}^{-1}$  and ( 3305 )  $\text{cm}^{-1}$  due to  $\nu$  (C=N) ,  $\nu$ (C=H) aromatic ,  $\nu$  (C=H) aliphatic and  $\nu$  (O=H) respectively as shown in table ( 3 ) fig.(2) and FT-IR spectrum of (A5) showed characteristic absorption bands ( 1662 ) $\text{cm}^{-1}$  , ( 3105 )  $\text{cm}^{-1}$  , ( 2850-2943 )  $\text{cm}^{-1}$  and (1531,1346)  $\text{cm}^{-1}$  due to  $\nu$  (C=N) ,  $\nu$ (C=H) aromatic ,  $\nu$  (C=H) aliphatic and  $\nu$  (C-NO<sub>2</sub>) respectively as shown in table ( 3 ) fig.(4)

The reaction was followed by disappearance of (NH<sub>2</sub>) absorption band at (3410-3298)  $\text{cm}^{-1}$  and appearance of (C=N) absorption band in the IR spectra of the products.

Attributed UV.spectrum of compounds (A2) and (A5) showed on absorption  $\lambda$  max at (335) nm and (278) nm which to ( $\pi - \pi^*$ ) the absorption show in fig.(7),fig.(8) and fig.(6) show the U.V. spectrum for the original compound. In the <sup>1</sup>H-NMR spectrum data of compound (A5) showed signals at (8.15-8.39) ppm was attributed to proton in (N=CH), and multiples signals at (7.13-7.39) ppm due to aromatic proton, and signals at (6.74) ppm due to (O-H) proton as shown in fig (11).

In the <sup>13</sup>C-NMR spectrum of compounds (A5) showed signal at (192) ppm for carbonyl group(C=N), while the signal at (123-137) ppm for aromatic carbons as shown as in fig. (12) .

## Synthesis of new N-Substituted -3- chloro -2- azetidinones for 2, 4-Diamino-6-phenyl-1,3,5-triazine ..... Tamador A. Mahmood

**Second step:** The second step includes preparation of new six azetidinone compounds (B1-B6) (N-substituted-3-chloro-2- azetidinones) were prepared by reaction of chloro acetyl chloride with the prepared Schiff bases (A1-A6) in first step. The prepared compounds were characterized by physical properties, FT-IR, UV and some of them by  $^1\text{H-NMR}$  ,  $^{13}\text{C-NMR}$  spectroscopy were recorded.

The synthesis of these compounds was carried out lined in scheme 1. And the physical properties for compounds (B1-B6) including melting point range of ( 102-239) °C and %yield were ranged (57.5-70) and these compounds were identified by FT-IR, UV,  $^1\text{H-NMR}$  and  $^{13}\text{C-NMR}$  spectroscopy.

FT-IR spectrum of compounds (B1, B5) showed clear absorption bands at (1735, 1705)  $\text{cm}^{-1}$  respectively at tribute to (C=O) imide stretching frequency is good evidence for the success of this step of reaction while disappearance of  $\nu$  (C=N) absorption bands at (1670, 1662)  $\text{cm}^{-1}$  respectively in IR spectra of the products. The IR absorption bands are given in table ( 3) see fig.(3 ) and fig.(5).

In the  $^1\text{H-NMR}$  spectrum of compound (B5) showed signals at (10.13) ppm was to (N-CH) proton , and multiples signal at (7.45-8.35) ppm due to aromatic protons , and singlet signet signals at (5.82) ppm due to (O-H) proton as shown in fig (13).

In the  $^{13}\text{C-NMR}$  spectrum of compounds (B5) showed signal at(162.8-165.2) ppm for carbonyl group(C=O), while the signal at (123-133) ppm for aromatic carbons as shown in fig.(14) , UV spectrum of compound (B2, B5) showed an absorption  $\lambda$  max at (272) nm, (277) nm which attributed to ( $\pi - \pi^*$ ) as shown in fig ( 9 ) and fig ( 10 ).
